RENISHAW
apply innovation™

Styli and accessories

When precision counts, insist on genuine Renishaw styli. Don’t settle for less!

RENISHAW
apply innovation™

Contents

Section 1

Technical specifications quick reference guides

Quick selection from our extensive range.

Section 2

Accuracy at the point of contact

An explanation of why it is important to choose the right stylus for your application and an overview of the entire range of stylus types.

Section 3

M2 threaded stylus range

Styli for use with the industry standard CMM probes TP2, TP20, TP200 and REVO™.

Section 4

M3 threaded stylus range

Styli for use with manual CMM probes TP1 and TP6 and the most flexible scanning probe, SP25M and REVO™.

Section 5

M4 threaded stylus range

Optimised for stiffness and weight, styli purposefully designed for the high accuracy TP7M and our comprehensive range of probing for machine tools.

Section 6

M5 threaded stylus range

A premium range specifically designed for highest accuracy scanning probes from Renishaw and other manufacturers.

Section 7

Styli for Faro arms

These styli have been designed especially for use on Faro portable arm CMMs.

Section 8

Accessories

All of the 'bits and pieces' that you need to assemble anything from the most complex stylus clusters to a simple star.

Section 9

Product listing by part number

The complete catalogue presented in part number order.

Technical specifications

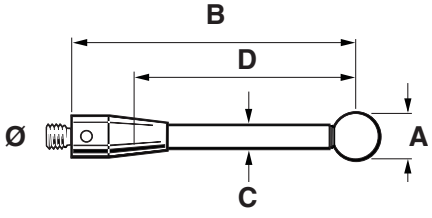

Tip material properties

Stylus type	Material	Grade	Deviation from spherical form	Structure	Composition	Purity	Density	Hardness	Compression strength	Bending strength	Fracture toughness K1c
			(µm)	–	(wt%)	(%)	(g/cm^3)	HV	(MPa)	(MPa)	($MN/m^{3/2}$)

Accuracy at the point of contact

2.1

Accuracy at the point of contact

As industry has developed its requirement for increasingly diverse and complex manufactured parts, inspection systems have had to work hard to keep up. The use of co-ordinate measuring machines (CMMs) with probing systems and in-process inspection on machine tools are two of the solutions offered by Renishaw to help you maximise your productivity and maintain the highest quality.

Successful gauging depends very much on the ability of the probe's stylus to access a feature and then maintain accuracy at the point of contact. At Renishaw, we have used our expertise in probe and stylus design to develop a comprehensive range of CMM and machine tool styli to offer you the greatest possible precision.

These notes explain the critical features of every stylus type, helping you to choose the right design for each inspection need.

What is a stylus?

A stylus is that part of the measuring system which makes contact with the component, causing the probe's mechanism to displace. The generated signal enables a measurement to be taken. The feature to be inspected dictates the type and size of stylus used. In all cases, however, maximum rigidity of the stylus and perfect sphericity of the tip are vital.

To achieve this, Renishaw's stylus stems are produced on CNC machine tools to exacting standards. Great care is taken to ensure that location faces give maximum stiffness whilst stylus mass is optimised to suit Renishaw's range of probes.

Genuine Renishaw stylus balls are produced to the highest standards and are bonded to the stems in such a way as to ensure maximum joint integrity.

The performance of your gauging can easily be degraded if you use a stylus with poor ball roundness, poor ball location, bad thread fit or a compromised design that allows excessive bending during measurement. To ensure the integrity of the data you gather, make certain that you specify and use a stylus from the comprehensive range of genuine Renishaw styli.

What naming protocol do Renishaw use to describe their styli range?

Renishaw uses the following naming protocol to allow easy identification of styli by name and part number. The examples below show how this protocol is assigned and describe the abbreviations used:

Straight styli

M2 STY D2R L20 EWL14 d1.4SS

The above protocol describes an M2 threaded straight stylus fitted with a 2 mm diameter ruby ball. It has an overall length of 20 mm, has an effective working length (EWL) of 14 mm and has a 1.4 mm diameter stainless steel stem.

Star styli

M2 STR D2R L20 5BALL L19.5 S32

The above protocol describes an M2 threaded star stylus fitted with a 2 mm diameter ruby ball. It has 5 balls on the star and an overall length of 19.5 mm (from the centre of the ball to the rear of the star mounting face when assembled to a probe). The span of the star cluster is 32 mm.

Disc styli

M2 DSC SD18 SLVS T2.2 L2.6 BR-Y

The above protocol describes an M2 threaded disc stylus with a spherical diameter disc of 18 mm. It is made from silver steel with a disc thickness of 2.2 mm and a length of 2.6 mm. BR stands for balls/rollers followed by yes (Y) or no (N).

Cylinder styli

M2 CYL D3 SLVS L13 EWL4

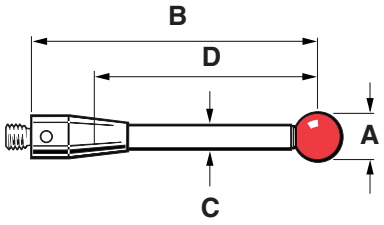

The above protocol describes an M2 threaded cylinder stylus with a critical measuring element diameter of 3 mm made from silver steel. It has an overall length of 13 mm and an EWL of 4 mm.

Extensions

M4 EXT L15 d7 SS

The above protocol describes an M4 threaded extension with a length of 15 mm diameter and a diameter of 7 mm. The extension is made from stainless steel.

Terminology

A Ball diameter
B Overall length
C Stem diameter
D Effective working length

Overall length

Renishaw uses a standard description of overall length, measuring from the rear mounting face of the stylus to the centre of the ball.

Effective working length (EWL)

This is measured from the centre of the ball to the point at which the stem will foul against the feature when measuring 'normal' to the part.

Choosing a stylus

To maintain accuracy at the point of contact we recommend that you:

Keep styli short

The more that a stylus bends or deflects, the lower the accuracy. Probing with the minimum stylus length for your application is the best option.

Minimise joints

Every time you join styli and extensions, you introduce potential bending and deflection points. Try, wherever possible, to keep to the minimum number of pieces for your application.

Keep the ball as large as possible

There are two reasons for this;

- firstly, it maximises your ball/stem clearance thereby reducing the chances for false triggers caused by 'shanking out' on the stylus stem
- secondly, the larger ball reduces the effect of the surface finish of the component being inspected.

The range of genuine Renishaw styli

Ball material

Ruby

The industry standard and the optimum stylus ball material for a vast majority of measurement applications, ruby is one of the hardest known materials. Synthetic ruby is 99% pure aluminium oxide which is grown into crystals (or “boules”) at 2000 °C using the Verneuil process.

The boules are then cut and gradually machined into a highly spherical form. Ruby balls are exceptionally smooth on the surface, have great compressive strength and a high resistance to mechanical corrosion.

Very few applications exists where ruby is not the preferred ball material, however there are two applications where balls manufactured from other materials are recommended.

The first is for heavy duty scanning applications on aluminium. Because the materials attract, a phenomenon known as ‘adhesive wear’ can occur which involves build up of aluminium from the surface onto the ball. A better ball material for such applications is silicon nitride.

The second is in heavy duty scanning applications on cast iron. Interaction between the two materials can result in ‘abrasive wear’ of the ruby ball surface. For such applications, Zirconia balls are recommended.

Silicon nitride

Silicon nitride possesses many similar properties to ruby. It is a very hard and wear-resistant ceramic which can be machined into very high precision spheres. It can also be polished to an extremely smooth surface finish. Silicon nitride does not have the attraction to aluminium and so does not exhibit the adhesive wear seen with ruby in similar applications. However, silicon nitride does show significant abrasive wear characteristics when scanning on steel surfaces and so its applications are best confined to aluminium.

Zirconia

Zirconia is a particularly tough ceramic material with hardness and wear characteristics approaching those of ruby. Its surface properties make it an ideal material for aggressive scanning applications on cast iron components.

Stem material

Steel

Stylus stems manufactured from stainless steel are used widely for styli with ball/tip diameters of 2 mm or greater and with lengths up to 30 mm. Within this range, one-piece steel stems offer the optimum stiffness to weight ratio, giving adequate ball/stem clearance without compromising stiffness with a joint between the stem and threaded body.

Please contact us if you require any styli with special ball materials. We can recommend the most suitable material for scanning different materials

Tungsten carbide

Tungsten carbide stems are best used for maximising stiffness with either small stem diameters required for ball diameters of 1 mm and below, or lengths up to 50 mm. Beyond this, weight can become a problem and stiffness is lost due to deflection at the stem to body joint.

Ceramic

For ball diameters greater than 3 mm, and lengths over 30 mm, ceramic stems offer stiffness comparable to steel but are significantly lighter than tungsten carbide. Ceramic stemmed styli can also offer additional crash protection to your probe as the stem will shatter in a collision.

Carbon fibre (Renishaw GF)

There are many grades of carbon fibre materials. However, Renishaw GF combines optimum stiffness characteristics, both longitudinally and in torsion (important in star constructions), with extremely low weight. Carbon fibre is inert and this, combined with a special resin matrix, provides excellent protection in the most hostile of machine tool environments.

Renishaw GF is ideal for maximising stiffness while giving very low mass for styli above 50 mm in length. It is the optimum stem material for high accuracy strain gauge technology probes with excellent vibration damping characteristics and negligible co-efficient of thermal expansion.

The genuine Renishaw stylus range comprises several types:

Straight styli

These are the simplest form of stylus, incorporating highly spherical industrial ruby balls and a choice of stem material.

Ruby is an extremely hard material and hence stylus wear is minimised. It is also of low density, keeping tip mass to a minimum, which avoids unwanted probe triggers caused by machine motion or vibration.

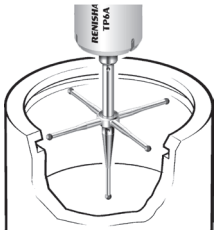

Mounted on stems made from a range of materials – stainless steel, tungsten carbide, ceramic and a specialised carbon fibre material, “Renishaw GF” – these simple ruby ball styli are suitable for most inspection applications.

Each stylus has an effective working length (EWL) which is the penetration that can be achieved by the ball before the stem fouls against the feature.

The size of the ball and the EWL of the stylus chosen are dictated by the size of the feature to be inspected. However, keeping the stylus ball as large as possible and the stem as short as possible will ensure maximum ball/stem clearance, whilst providing a greater yet still rigid EWL. Using larger ruby balls also reduces the effect of the surface finish of the component being inspected.

Probing with very long stylus/extension combinations is not recommended with standard kinematic touch trigger probes as the rigidity is reduced and accuracy lost due to stylus bending. This is not the case with other types of probe such as those with strain gauge technology, as their very low trigger forces permit the use of long stylus/extension combinations without a significant loss of accuracy.

Star styli

These stylus clusters provide you with multiple-tip probing of complex features and bores. Four or five ruby ball systems are mounted rigidly on a stainless steel centre. Three standard sizes are offered – alternatively, you can create custom-made star styli using a 5-way stylus centre and any of the genuine Renishaw stylus range.

Star styli can be used to inspect a variety of different features. Their use can reduce inspection cycle times by allowing multi-tip probing, minimising the need to move the probe to extreme points of internal features such as the sides or grooves in a bore. Using star styli also allows effective probing in the –Z (upwards) direction when using a 5-way probe, provided that the stylus tips extend beyond the diameter of the probe body. Each tip on a star stylus requires datuming (sometimes referred to as ‘qualifying’ or ‘calibrating’) in the same manner as a single-ball stylus. The 'span' of star styli is taken from ball centre to ball centre.

Disc styli

These styli are used to probe undercuts and grooves within bores which may be inaccessible to star styli. They are ‘sections’ of highly spherical balls and are available in various diameters and thicknesses. Full rotational adjustment and the ability to add a centre stylus are features of the Renishaw range of disc styli that make them particularly flexible and easy to use.

Probing with the 'spherical edge' of a simple disc is effectively the same as probing on or about the equator of a large stylus ball. However, only a small area of this ball surface is available for contact and hence thinner discs require careful angular alignment in order to ensure correct contact with the feature being probed.

A simple disc requires datuming for only one diameter (usually in a ring gauge), but limits effective probing to only X and Y directions.

Adding a 'radius end roller' allows you to datum and hence probe in the Z direction, provided that the centre of the 'radius end roller' extends beyond the diameter of the probe. The 'radius end roller' can be datumed on a sphere or a slip gauge. Rotating and locking the disc about its centre axis allows the 'radius end roller' to be positioned to suit the application.

Discs may also have a threaded centre to allow the fixing of a centre stylus, giving the additional flexibility of probing the bottom of deep bores (where access for the disc may be limited).

Styli for specialist applications

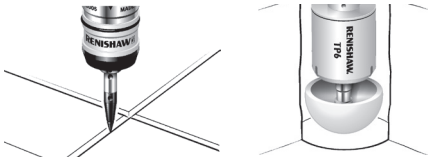

A range of specialist styli is available to enable probing of features such as thread form, thin sectioned material, tool setting and other specialist applications.

Cylinder styli

These are used for probing holes in thin sheet material. In addition, various threaded features can be probed and the centres of tapped holes located. Ball-ended cylinder styli allow full datuming and probing in X, Y and Z directions, thus allowing surface inspection to be performed.

Pointer and ceramic hollow ball styli

Pointer styli are designed for the inspection of thread forms, specific points and scribed lines (to lower accuracy). The use of a radius end pointer stylus allows more accurate datuming and probing of features as detailed above and can also be used to inspect the location of very small holes.

Ceramic hollow ball styli are ideal for probing deep features and bores in X, Y and Z directions, with the need to datum only one ball. There are two versions in the range, 18 and 30 mm diameter, specially designed for the TP2 / TP20 / TP200 and TP6 probes respectively. Probing with such a large diameter ball can average out the effects of very rough surfaces.

Tool setting styli

Typically, these are fitted with a square tip and can have threaded or plain shaft attachments. The tip faces are ground to ensure high squareness and parallelism. The TS27R tool setting probe for machining centres can also be fitted with a tungsten carbide disc stylus.

Crash protection devices

Renishaw's stylus crash protection devices are designed to break in the event of impact and protect the probe from damage.

Accessories and tools

A wide range of accessories including extensions, 4 and 5-way centres and stylus knuckles complement the genuine Renishaw stylus range to achieve fully flexible inspection.

Stylus centres

These provide maximum probing flexibility with a single probe. Taking up to five styli of the same mounting thread, this accessory allows you to build stylus configurations to your own specification.

Stylus knuckles

These give full adjustment about two axes, allowing the stylus to be orientated to probe angled features. This adjustment is especially useful when the probe cannot be correctly orientated by the probe head, or when access for the head is limited.

Stylus extensions

These provide additional probing penetration by extending the stylus away from the probe. However, using stylus extensions can reduce probe accuracy due to loss of rigidity. This is not the case with electronic probes, whose extremely low trigger forces render them less sensitive to this type of inaccuracy.

Stylus thread adaptors

These allow M2, M3, M4 and M5 threaded styli to be interchanged on the majority of touch trigger probes. They are particularly useful for adapting the extensive range of specialised application M2 styli for use on larger probes.

Stylus tools

Specifically designed for mounting styli correctly onto probes and for the construction of specialised stylus combinations, Renishaw's stylus tools protect your investment.

The S7 stylus tool

The stylus tool is used for tightening styli and accessories when connecting to one another or directly into the probe.
It is specifically designed to yield if excessive tightening force is applied, avoiding damage to the threads of stylus and probe.

A stylus crank

A stylus crank can allow access to features that are otherwise difficult to reach, and are often used in lathe inspection applications.

Renishaw stylus kits

Renishaw styli and accessories are available in a wide selection of kits, ranging from a small precision set of the most frequently used styli, to a comprehensive set to meet virtually every inspection need.

Some sets are housed in a quality wooden case for maximum protection and superb presentation. The styli are held in a wood insert, individually located in a nylon sleeve providing protection for the mounting threads. This type of box features a removable module which houses up to twelve ruby ball styli and contains a tray for discs, tools and accessories. This allows the stylus selection for a particular inspection task to be brought to the CMM's table. The sloping lid design of this kit provides easy access to styli, minimising handling of ruby balls and contact surfaces, thus aiding cleanliness.

Probing kits are also available to include a probe, probe head, extension bars and styli.

Custom design service

Renishaw's Styli division offers a unique service by providing customers with a total custom stylus solution for their probing needs for CMM, machine tool, Equator or scanning applications, where a standard stylus may not be suitable.

The division includes expertise in applications, design, engineering and manufacturing with extensive experience in providing tailor-made stylus product solutions to specific customer's requirements.

Our expertise allows us to develop a product that satisfies customer demand for accuracy, piece part feature inspection, delivery and cost. All of these aspects are considered within the design of a custom stylus, ensuring that the solution incorporates the ideal choice of ball & stem materials and optimises probe performance for your particular application.

Renishaw's Styli division has designed over 10,000 different custom styli for a wide range of probing applications worldwide ranging from aeronautical & automotive to high volume manufacturing, so the solution to your application problem may already exist.

For advice and further details, please contact your nearest Renishaw distributor.

We always recommend using Renishaw styli in order to maximise your quality & probing performance.

Additional information

Grade 3 high accuracy styli

With the increased use of very high accuracy CMMs, the specification of the stylus ball has become a significant factor when calculating error budgets. High precision measuring machines require precision styli. Renishaw offers grade 3 styli with a form deviation of ± 0.08 microns.

The sphericity of your stylus ball can affect your CMM measurements. To ensure the accuracy of your measurements, use a minimum of AFBMA 3290 / DIN 5401-11.1993 Grade 5 balls.

As standard, Renishaw uses Grade 5 stylus balls with a sphericity of 0.13 µm and not the lesser Grade 10 balls that most other manufacturers use.

Grade 3 balls, with a sphericity of 0.08 µm, are also available.

Grade 3 ball design considerations:

Investigations into the effect of the design and construction of styli using such a highly specified ball have indicated that the form of the ball can be degraded by machining a hole in it and through distortion from gluing it onto a spigot. Renishaw has researched ways to improve the design of the high accuracy Grade 3 ball styli.

All Grade 3 styli being produced by Renishaw are constructed using an undrilled ball bonded into a spherical cup. Measurements taken before and after assembly of this design have shown that the form of the ball remains well within specification throughout the process.

In order to easily identify a Grade 3 ball stylus, the stems are coated in Titanium Nitride, giving them a gold coloured finish.

Due to limits of measurement capability and bond strength, Grade 3 ball styli are only available with a minimum ball diameter of 1 mm. The styli are not serialised and are supplied with a certificate of roundness.

Contact your local Renishaw office for more details.

RENISHAW
apply innovation™

M3 threaded stylus range

SP25M with two FCR25s on a modular rail system

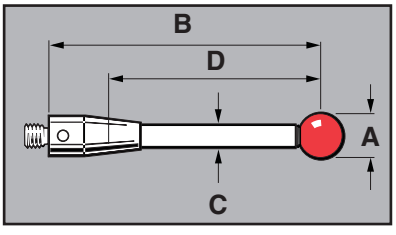

Renishaw's probing systems are designed to give optimum performance using styli from Renishaw's comprehensive range. The following probes all use M3 threaded styli, however, with suitable adaptors, other thread sizes may be used.

- **TP1**
- **TP6**
- **REVO®**
- **SP25M**

RENISHAW
apply innovation™

M4 threaded stylus range

The OSP60 is a high-speed optical 3D scanning probe for machining centres

Renishaw's probing systems are designed to give optimum performance using styli from Renishaw's comprehensive range. The following probes all use M4 threaded styli, however, with suitable adaptors, other thread sizes may be used.

* ESWL = Effective Scanning Working Length, measured from the centre of the ball to the point at which the stem will foul against a vertical face when at the maximum scanning deflection.

OSP60 standard range

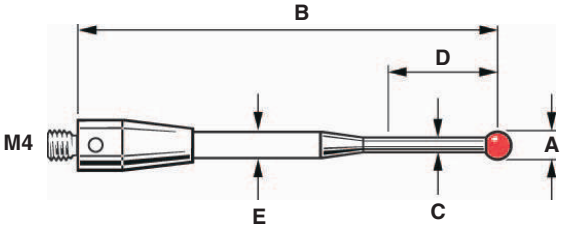

During scanning the stylus is constantly deflected, so the ceramic stem has been designed to be narrow and therefore tightly control all squareness tolerances. This ensures that even when measuring a part with vertical surfaces, such as on prismatic parts, the risk of the stylus shank contacting the part before the stylus tip is minimised.

OSP60 calibrated range

In the variable temperature environment typical of a machine tool, the dimensional variation of the calibration sphere, compared with the machine structure, can degrade the performance of the measurement system. In the highest accuracy applications, this contribution to the overall system measurement uncertainty can be significant.

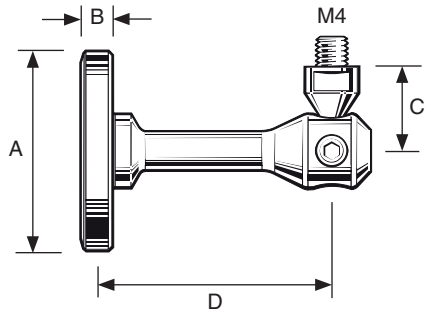

To ensure the highest possible measurement accuracy in all measurement conditions, the ball on each stylus within the OSP60 calibrated range is measured and UKAS certified. The exact ball diameter is engraved onto the stylus holder, so that this highly accurate value can be applied during probe calibration as an absolute reference.

Primo toolsetter stylus

Part number		A-5472-3000 Tungsten carbide
Ruby Silicon nitride Zirconia		
A	Disc dia. mm (in.)	26 (1.02)
B	Disc depth mm (in.)	4 (0.16)
C	Length A mm (in.)	11 (0.43)
D	Length B mm (in.)	31 (1.22)
	Mass grammes	34

Flat bottom cylinder stylus (tungsten carbide)

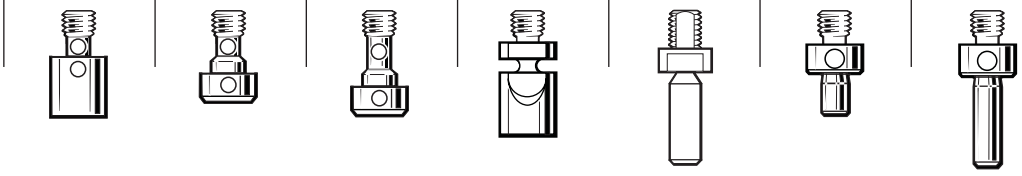

Part number	A-5004-5370 Tungsten carbide
Cylinder dia. mm (in.)	1.0 (0.04)
Overall length mm (in.)	20.0 (0.79)
EWL mm (in.)	10.0 (0.40)
Mass grammes	2.5

This flat-bottomed stylus has been specifically designed for xy and accurate z point measurement with the face being precision ground parallel.

	Mass grammes	6.2	11.9	18.2	6.9	3.8

These styli are for use on job contact probes; the tungsten carbide balls have been brazed to the stem to ensure conductivity through the stylus. The resistance of these styli are specified to be less than 0.1 Ω to ensure accurate measurement with your probe.

*Effective working length

RENISHAW
apply innovation™

M5 threaded stylus range

SP80 is an ultra-accurate quill-mounted scanning probe

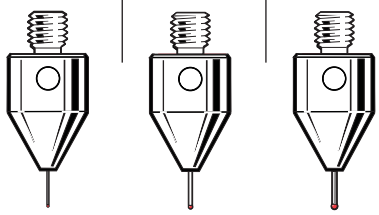

Renishaw's probing systems are designed to give optimum performance using styli from its comprehensive range. The following probes all use M5 threaded styli, however, with suitable adaptors, other thread sizes may be used.

- **SP80**

Styli for Faro arms

7.1

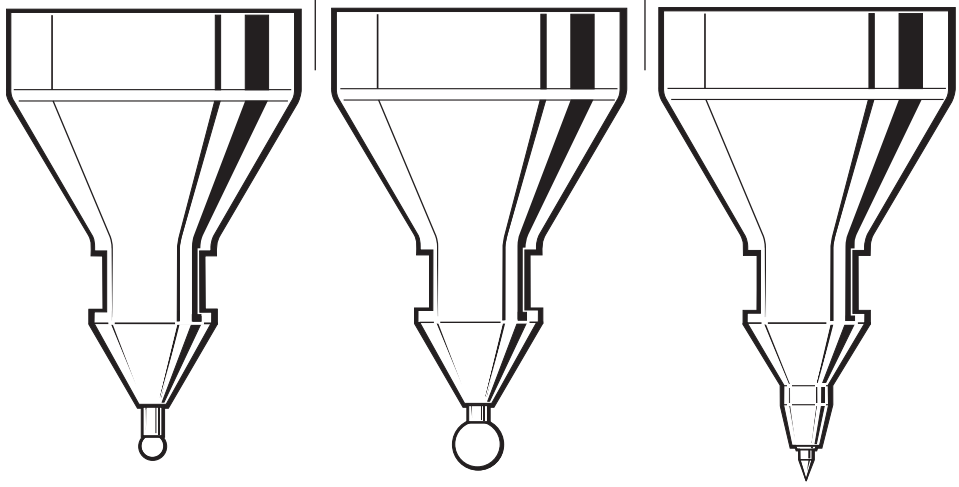

Styli for Faro arms

These styli have been designed especially for use on Faro portable arm CMMs. Their robust design and construction utilizes Grade 5 Zirconia balls that have a high fracture toughness. The balls are bonded to the high strength tungsten carbide stem with impact resistant adhesive, and specialist construction techniques have been incorporated to ensure that the joint between the body and stem is extremely rigid and virtually indestructible.

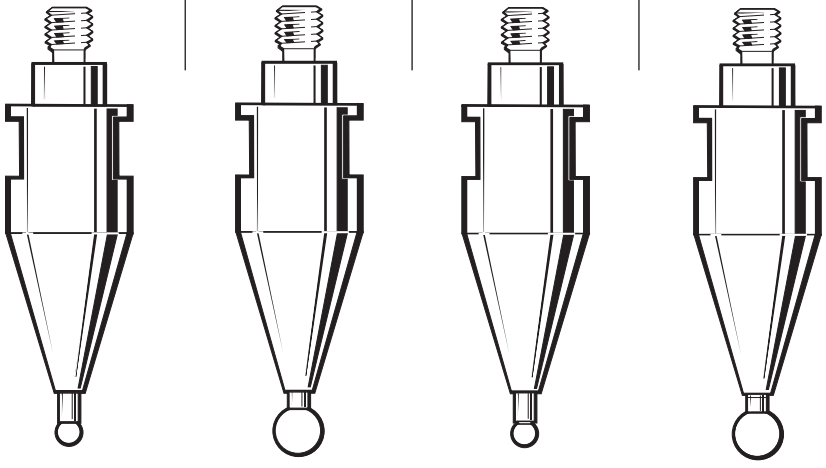

1¼–20 UN thread styli

For M4 threaded styli

A-5004-7614
For M5 threaded styli

A-5003-2300
For the M2 carbon fibre range of styli

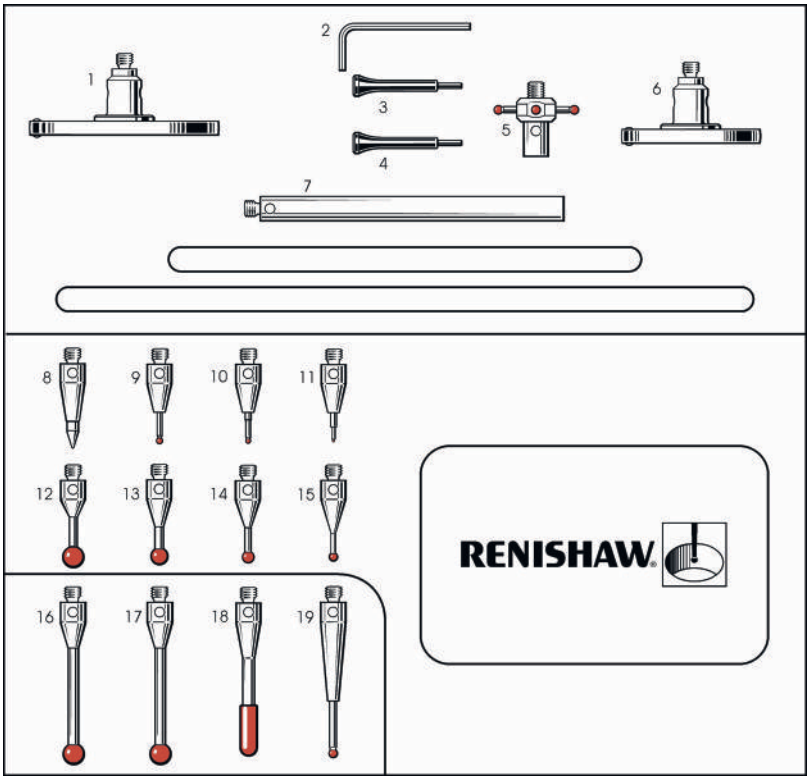

This tool is to be used exclusively to tighten all M2 carbon fibre extensions. The tool has been designed to tighten the extensions to the correct torque value & will click when value has been reached. Do not overtighten past the click as this could potentially damage the component you are tightening.

These tools are designed to fit styli to Renishaw probes without causing internal damage

Ø25 mm	datum ball	A-1034-0002	A-1034-0596
Ø¾ in.	datum ball	A-1034-0032	A-1034-0358
Ø1 in.	datum ball	A-1034-0036	A-1034-0243

Revo datum ball		Part number
Ø45 mm	M10F	A-3060-0310

A certified Ceramic ball is used on the Revo datum sphere

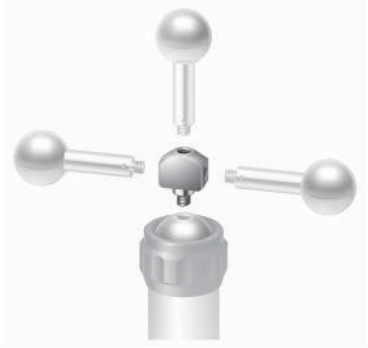

Accessories	Part number
2 way adaptor	A-1034-0356
3 way adaptor	A-1034-0357
Pillar extension 75 mm	A-1034-0355
Magnetic base	A-1034-0385
45° magnetic base	A-1034-0550
Gramme gauge 4 - 30 g	P-GA01-0001

2 way

Pillar

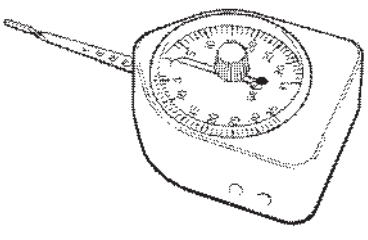

Magnetic base

3 way

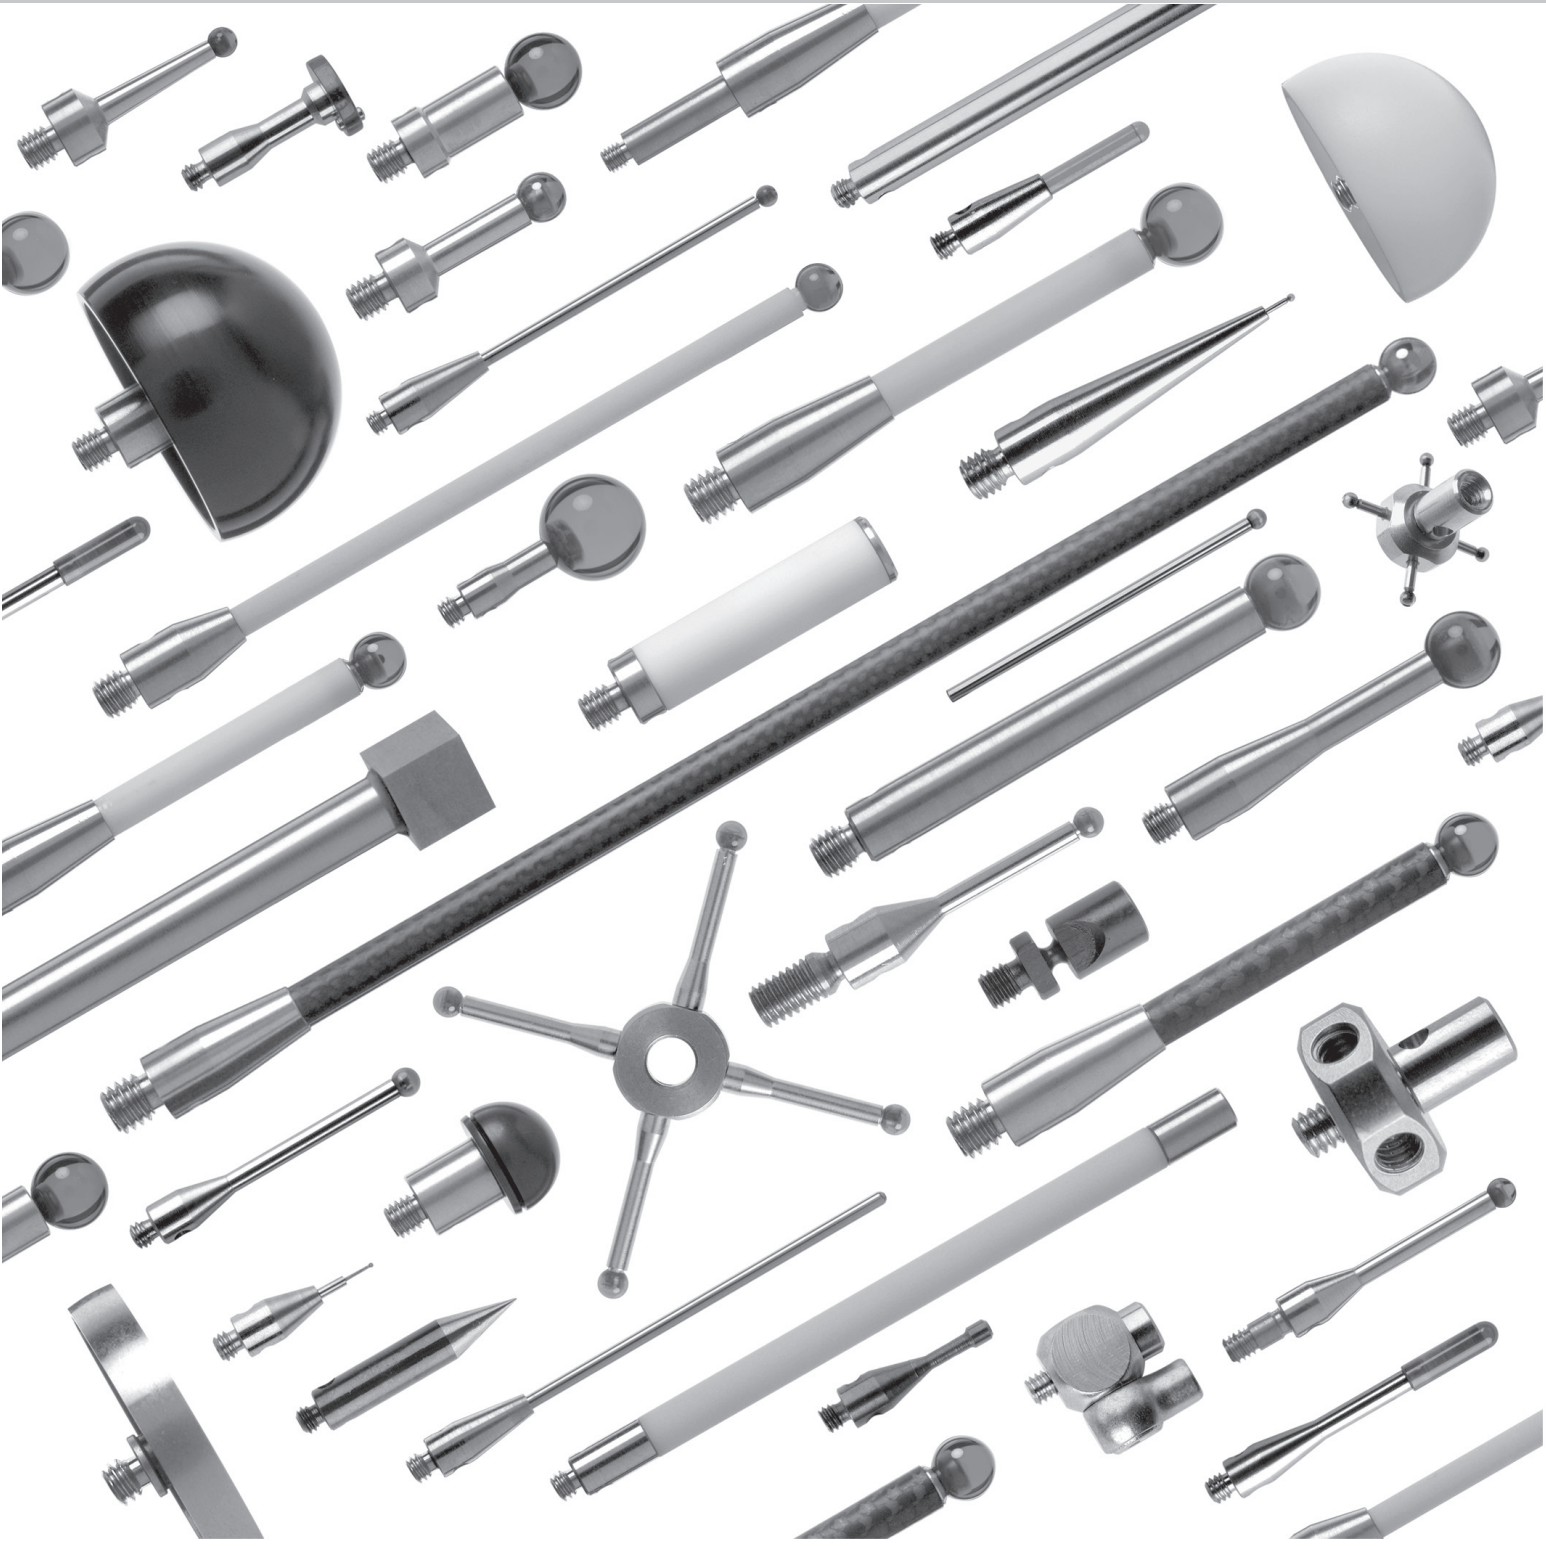

45° magnetic base

About Renishaw

Renishaw is an established world leader in engineering technologies, with a strong history of innovation in product development and manufacturing. Since its formation in 1973, the company has supplied leading-edge products that increase process productivity, improve product quality and deliver cost-effective automation solutions.

A worldwide network of subsidiary companies and distributors provides exceptional service and support for its customers.

Products include:

- Additive manufacturing and vacuum casting technologies for design, prototyping, and production applications
- Dental CAD/CAM scanning systems and supply of dental structures
- Encoder systems for high-accuracy linear, angle and rotary position feedback
- Fixturing for CMMs (co-ordinate measuring machines) and gauging systems
- Gauging systems for comparative measurement of machined parts
- High-speed laser measurement and surveying systems for use in extreme environments
- Laser and ballbar systems for performance measurement and calibration of machines
- Medical devices for neurosurgical applications
- Probe systems and software for job set-up, tool setting and inspection on CNC machine tools
- Raman spectroscopy systems for non-destructive material analysis
- Sensor systems and software for measurement on CMMs
- Styli for CMM and machine tool probe applications

Stylus selection

The TP7M is high accuracy probe specifically designed to maintain a high level of accuracy and reliability across a wide spectrum of applications. For best performance, the guidelines given should be followed:

Do not:

- use more than 50 mm of M3 or M2 styli, or accessories
- use M2 styli within 30 mm of the probe mounting face or probe axis
- use the M4 / M2 (SA5) adaptor, use the M4 / M3 and the M3 / M2 adaptors instead
- do not use stylus knuckle joints

Do:

- use the longest possible M4 stylus extensions or M4 / M3 adaptor extensions to achieve a required stylus length
- follow the guidelines in the TP7M user's guide (Renishaw part number H-1000-5010) for stylus selection
- use M3 and M4 styli wherever possible to maximise the stiffness of the stylus configuration, however, M2 styli can be used if necessary for workpiece access
- tighten up styli adequately using the stylus tools provided
- ensure stylus ball is kept clean at all times by using distilled water or a proprietary cleaning fluid
